Experiment 8

Name:SRIVATSEN.S 240701534

AIM:

To create storyboards representing the user flow of an application using Balsamiq.

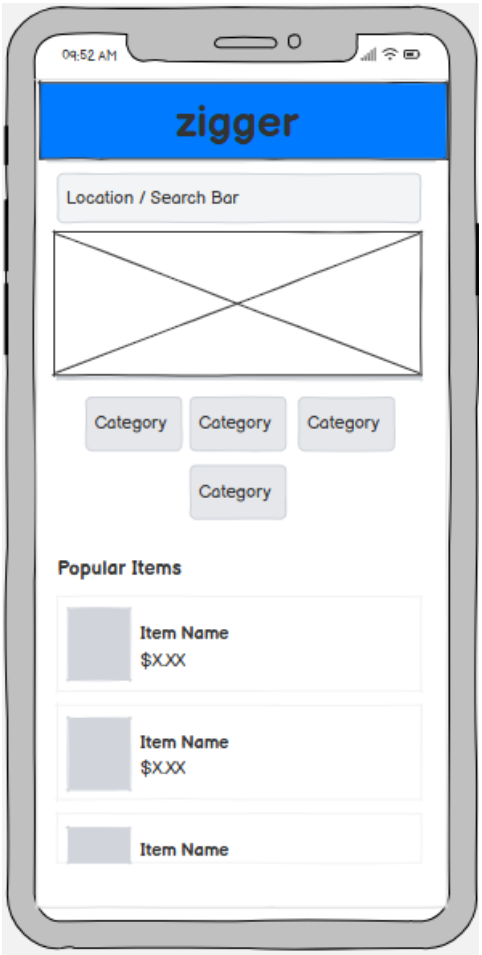
FRAME 1:

HOME SCREEN:

Analysis of the Home Screen

The home screen acts as the entry point of the application. It contains a search bar, category options, and featured items to help users quickly explore available choices.

The layout is designed with clear visual hierarchy, allowing users to easily identify key sections such as categories and popular items. The simple arrangement reduces cognitive load and improves navigation efficiency.



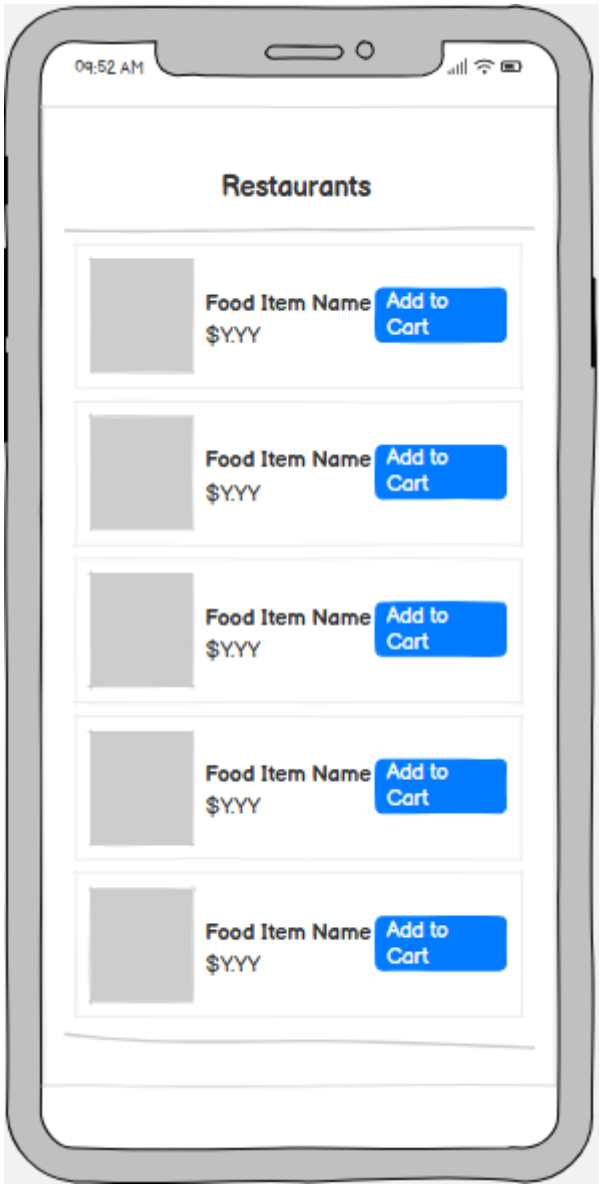
FRAME 2:

MENU SCREEN:

Analysis of the Menu Screen

This screen displays a list of available items with relevant details such as name and price. Each item includes an “Add to Cart” button, enabling quick user interaction.

The structured list format helps users scan multiple items efficiently. Grouping items in a consistent layout improves usability and ensures smooth browsing experience.



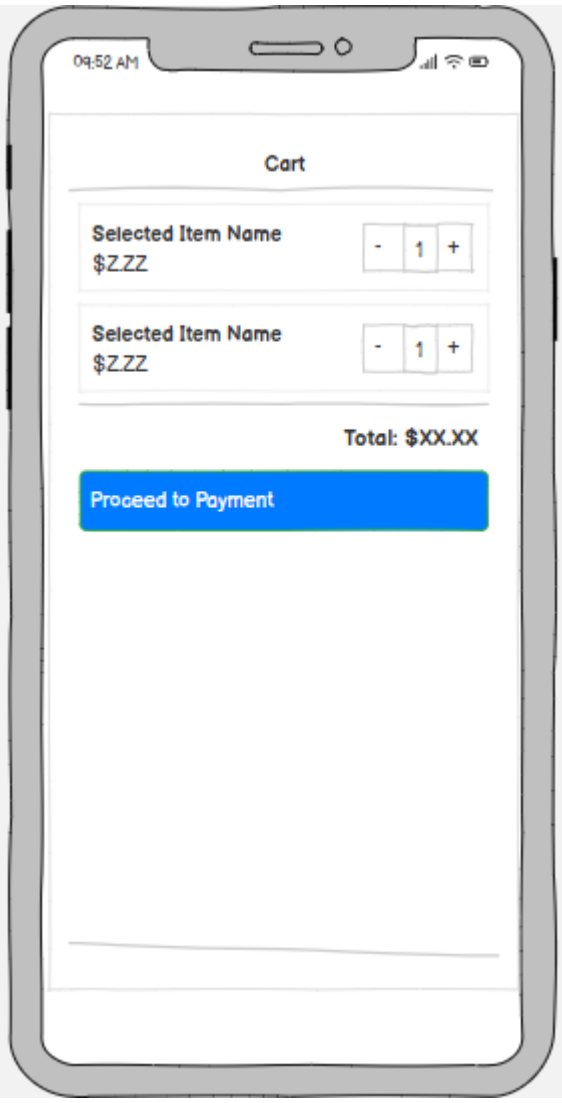
FRAME 3:

CART SCREEN:

Analysis of the Cart Screen

The cart screen shows selected items along with quantity and total price. Users can modify their selections using simple controls.

This screen provides clarity and transparency before proceeding to payment. The clear display of total cost helps users make informed decisions, improving overall user satisfaction.



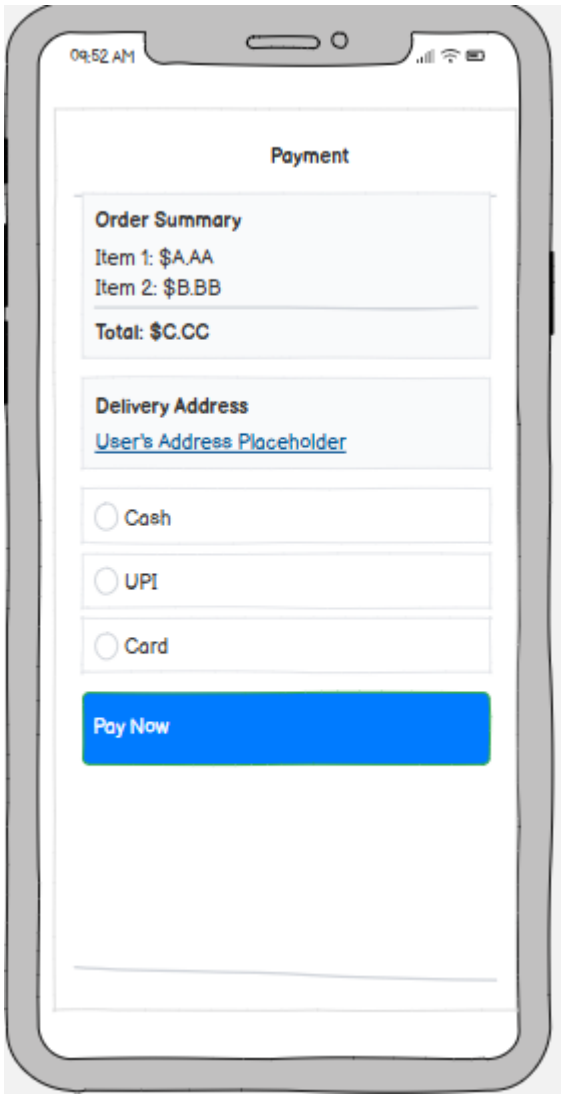
FRAME 4:

PAYMENT SCREEN:

Analysis of the Payment Screen

The payment screen presents order summary, delivery details, and multiple payment options such as UPI, card, or cash. A clear “Pay Now” button guides the user to complete the transaction.

The organized layout ensures users can quickly verify their order and choose a preferred payment method, reducing friction in the checkout process.



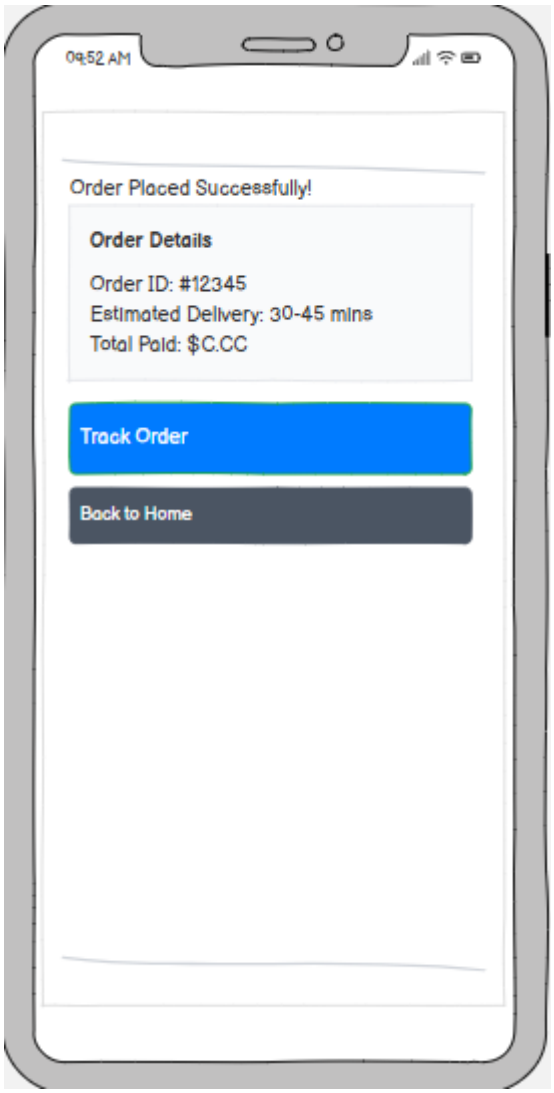
FRAME 5:

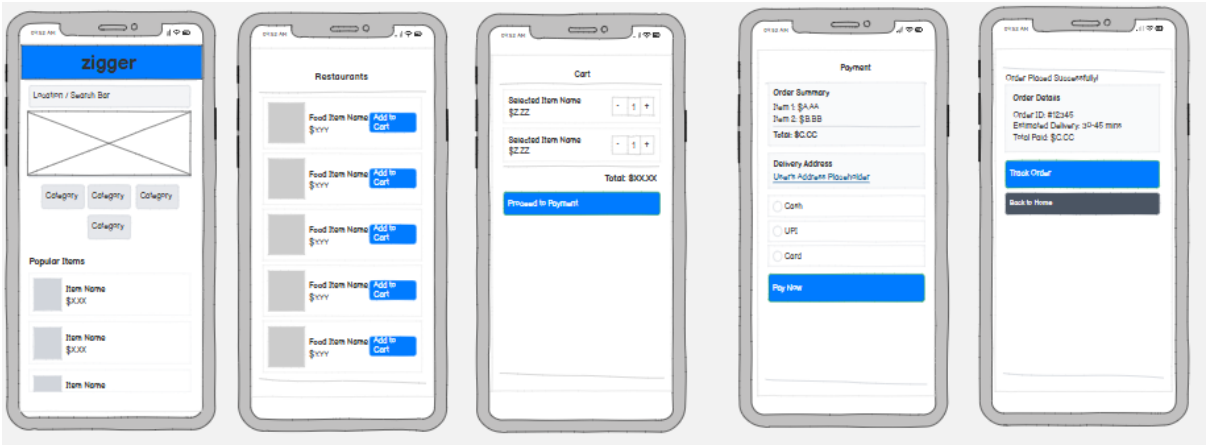
ORDER PLACED SCREEN:

Analysis of the Order Confirmation Screen

This screen confirms that the order has been successfully placed. It displays order details and provides options such as “Track Order” or “Back to Home.”

Immediate feedback enhances user confidence and satisfaction. The presence of action buttons allows users to continue interaction seamlessly.





CONCLUSION:

This experiment demonstrates how user flow can be effectively represented using a storyboard in Balsamiq. By organizing screens in a logical sequence, the design improves usability and ensures a smooth user experience. The low-fidelity wireframe helps in visualizing application structure before development.
