Experiment 6

NAME:SRIVATSEN.S ROLL NO:240701534

Aim:

To design a wireframe for a application and ensure that the UI screens follow a clear and structured task flow from user entry to order completion.

In this experiment, I created a food delivery app wireframe and designed a corresponding task flow to represent how a user interacts with the app step by step.

The application begins with a welcome screen where the user is given options to either get started or log in. Based on this choice, the user is directed to either the sign-up screen or login screen.

In the sign-up process, the user enters basic details such as name, email, phone number, and password. If the details are valid, the account is created successfully. In the login process, the user enters credentials, and upon correct validation, access is granted.

After authentication, the user reaches the home screen. This screen allows the user to browse food categories or search for restaurants. The design ensures that navigation is simple and visually clear.

When a user selects a food item, the app displays detailed information such as price and description. The user can then add the item to the cart.

The cart section plays an important role in the flow. If the cart is empty, the user is redirected to browse food again. If items are present, the user proceeds to checkout.

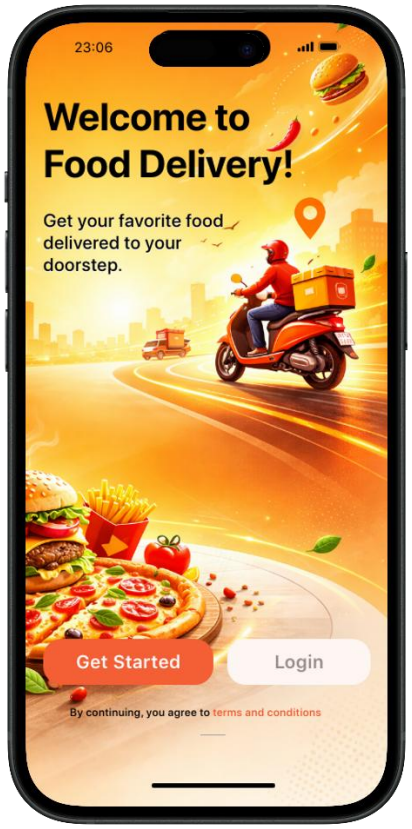
During checkout, the user enters the delivery address, reviews the selected items, and optionally applies a promo code. The system then displays a summary including price, delivery charges, and discounts.

Finally, the user places the order. If all details are correct, the system confirms the order and displays a confirmation message. The user can then return to the home screen.

The task flow diagram was created alongside the wireframe to ensure that every screen corresponds to a step in the user journey. This helped maintain consistency between design and functionality.

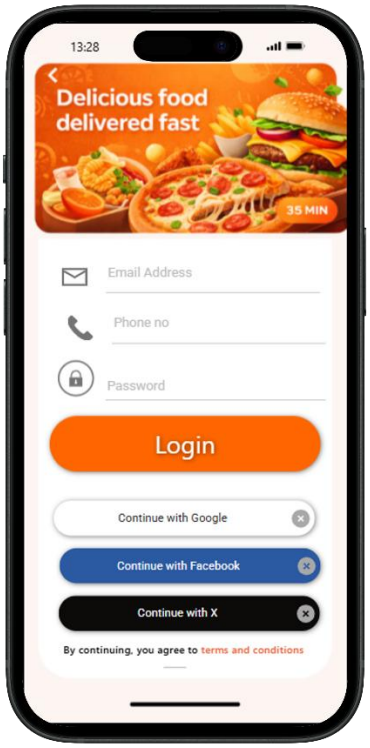
Screen 1: Welcome Page

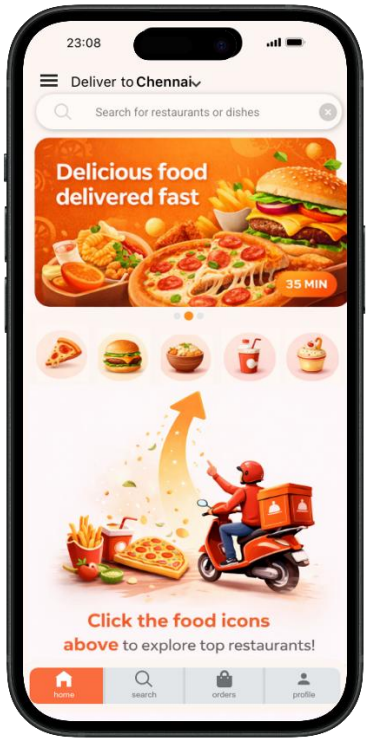
The welcome page introduces the food delivery application with a visually attractive food-themed background.



Screen 2: Home Page

The home page acts as the central navigation hub of the application.

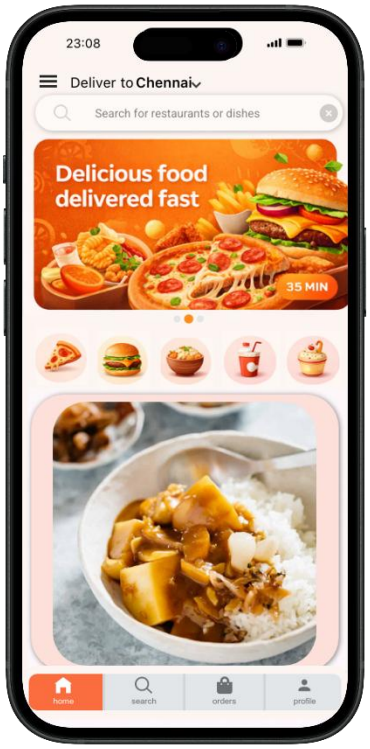




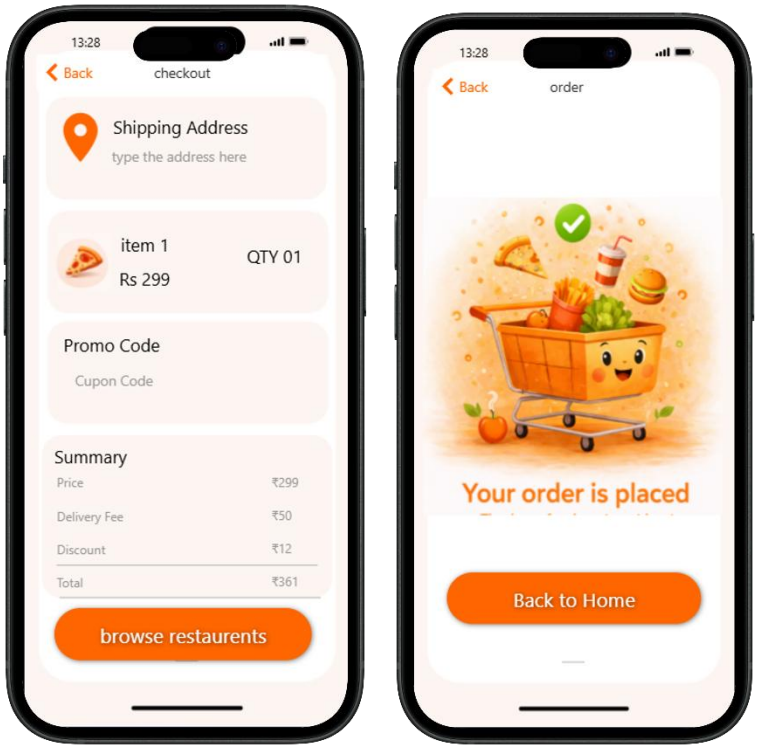
Screen 3: Category Navigation

When users click on a category:

- Clicking **Pizza** → Displays pizza restaurants with image and name
- Clicking **Burger** → Displays burger restaurants
- Clicking **Biryani, Drinks, Desserts** → Similar filtered results
- 



Screen 4: Checkout and payment



Conclusion

Through this experiment, I understood how to design a wireframe that aligns with a structured task flow. It helped me visualize how users move through different stages of an application and how each screen should support that flow. Maintaining consistency between the task flow and UI design improves usability and makes the application more intuitive.
